

Tuning molecular motors

Bernd Hartke

Christian-Albrechts-Universität zu Kiel – Theoretische Chemie

Within SFB 677 "Function by Switching", we are using theoretical simulations of photochemical de-excitation dynamics to systematically investigate and improve the performance of light-driven molecular switches, both in isolation and as motor units in molecular machines. This talk focuses on how azobenzene can be made more efficient and how these modified azobenzenes can be used to power artificial cilia for directed transport.
